

Linked List Practice Questions

Question 1: Reverse a Linked List

Write a function to reverse a singly linked list. You must reverse it **in-place** without using extra space for another list.

Example:

Input: $1 \rightarrow 2 \rightarrow 3 \rightarrow 4 \rightarrow \text{NULL}$

Output: $4 \rightarrow 3 \rightarrow 2 \rightarrow 1 \rightarrow \text{NULL}$

Time Complexity: $O(n)$, **Space Complexity:** $O(1)$

Question 2: Detect Cycle in Linked List

Given a linked list, determine if it contains a cycle. A cycle occurs when a node's next pointer points back to a previous node in the list.

Example:

Input: $1 \rightarrow 2 \rightarrow 3 \rightarrow 4 \rightarrow 2$ (points back to node 2)

Output: true (cycle exists)

Hint: Use the Floyd's cycle detection algorithm (slow and fast pointers).

Time Complexity: $O(n)$, **Space Complexity:** $O(1)$

Question 3: Merge Two Sorted Linked Lists

Given two sorted singly linked lists, merge them into a single sorted linked list and return the head of the merged list.

Example:

Input: List1: $1 \rightarrow 3 \rightarrow 5 \rightarrow \text{NULL}$, List2: $2 \rightarrow 4 \rightarrow 6 \rightarrow \text{NULL}$

Output: $1 \rightarrow 2 \rightarrow 3 \rightarrow 4 \rightarrow 5 \rightarrow 6 \rightarrow \text{NULL}$

Hint: Use two pointers to traverse both lists and compare values.

Time Complexity: $O(n + m)$, **Space Complexity:** $O(1)$

Question 4: Find Middle of Linked List

Write a function to find the middle node of a singly linked list. If the list has an even number of nodes, return the second middle node.

Example:

Input: $1 \rightarrow 2 \rightarrow 3 \rightarrow 4 \rightarrow 5 \rightarrow \text{NULL}$

Output: 3 (the middle node)

Hint: Use slow and fast pointers (fast moves 2 steps, slow moves 1 step).

Time Complexity: $O(n)$, **Space Complexity:** $O(1)$

Question 5: Remove Duplicates from Sorted Linked List

Given a sorted singly linked list, remove duplicate nodes such that each value appears only once.

Example:

Input: $1 \rightarrow 1 \rightarrow 2 \rightarrow 2 \rightarrow 3 \rightarrow \text{NULL}$

Output: $1 \rightarrow 2 \rightarrow 3 \rightarrow \text{NULL}$

Time Complexity: $O(n)$, **Space Complexity:** $O(1)$

Question 6: Palindrome Linked List

Determine if a singly linked list is a palindrome (reads the same forward and backward).

Example:

Input: $1 \rightarrow 2 \rightarrow 3 \rightarrow 2 \rightarrow 1 \rightarrow \text{NULL}$

Output: true

Input: $1 \rightarrow 2 \rightarrow 3 \rightarrow \text{NULL}$

Output: false

Time Complexity: $O(n)$, **Space Complexity:** $O(1)$ if using slow/fast pointers and reversal

Question 7: Remove Nth Node From End of List

Given a singly linked list and an integer n , remove the n th node from the end of the list and return the head.

Example:

Input: $1 \rightarrow 2 \rightarrow 3 \rightarrow 4 \rightarrow 5 \rightarrow \text{NULL}$, $n = 2$

Output: $1 \rightarrow 2 \rightarrow 3 \rightarrow 5 \rightarrow \text{NULL}$ (removed node with value 4)

Hint: Use a dummy node to handle edge cases (like removing the head).

Time Complexity: $O(n)$, **Space Complexity:** $O(1)$

Question 8: Intersection of Two Linked Lists

Given two singly linked lists, find the node at which they intersect. If they do not intersect, return NULL.

Example:

List1: $4 \rightarrow 1 \rightarrow 8 \rightarrow 4 \rightarrow 5 \rightarrow \text{NULL}$

List2: $5 \rightarrow 0 \rightarrow 1 \rightarrow 8 \rightarrow 4 \rightarrow 5 \rightarrow \text{NULL}$

(They intersect at node with value 8)

Hint: Calculate lengths and use two pointers.

Time Complexity: $O(n + m)$, **Space Complexity:** $O(1)$

Question 9: Partition List Around a Value

Given a singly linked list and a value x , partition the list such that all nodes with values less than x come before all nodes with values greater than or equal to x . Preserve the original relative order of nodes.

Example:

Input: $1 \rightarrow 4 \rightarrow 3 \rightarrow 2 \rightarrow 5 \rightarrow 2 \rightarrow \text{NULL}$, $x = 3$

Output: $1 \rightarrow 2 \rightarrow 2 \rightarrow 4 \rightarrow 3 \rightarrow 5 \rightarrow \text{NULL}$

Time Complexity: $O(n)$, **Space Complexity:** $O(1)$

Question 10: Reverse Nodes in K-Group

Given a linked list, reverse the nodes in groups of k (where k is a given positive integer). If the number of nodes is not a multiple of k , then left-out nodes should remain as-is.

Example:

Input: $1 \rightarrow 2 \rightarrow 3 \rightarrow 4 \rightarrow 5 \rightarrow \text{NULL}$, $k = 2$

Output: $2 \rightarrow 1 \rightarrow 4 \rightarrow 3 \rightarrow 5 \rightarrow \text{NULL}$

Input: $1 \rightarrow 2 \rightarrow 3 \rightarrow 4 \rightarrow 5 \rightarrow \text{NULL}$, $k = 3$

Output: $3 \rightarrow 2 \rightarrow 1 \rightarrow 4 \rightarrow 5 \rightarrow \text{NULL}$

Time Complexity: $O(n)$, **Space Complexity:** $O(1)$ excluding recursion stack

Study Tips

1. **Master pointer manipulation:** Understand how to update pointers correctly to avoid losing references to nodes.[web:51]
2. **Use dummy nodes:** A dummy node pointing to the head simplifies edge case handling when modifying the list structure.[web:49]
3. **Slow and fast pointers:** This technique is essential for cycle detection, finding the middle, and other problems.[web:49][web:50]
4. **Practice recursion:** Many linked list problems can be solved recursively, which helps develop deeper understanding.[web:53]
5. **Draw diagrams:** Visualizing pointer movements prevents mistakes during implementation.[web:51]
